

Accudock Dock of the Month

Month: September 2011
Location: Tuscaloosa, AL
Event/Club: University of Alabama

When the University of Alabama needed to replace their wooden rowing dock, they contacted AccuDock to assist them with the perfect solution. The river they row on has extreme tidal fluctuations during spring tides and required a 30' gangway with two 30' control arms that would address their water level concerns. Last month, the dock was upgraded to accommodate more boats by adding additional section and we also learned about the flooding due to the tropical storms that caused extraordinary high water levels. The higher than normal rise of the river initially alarmed everyone until they realized the dock worked as designed and held up perfectly.
